

TOP SECRET

EXTRACT FROM IG SURVEY OF NPIC - JULY 1962

SECTION E

7. In the readout of highest priority COMOR targets, usually numbering about 250 items and known as the OAK report, DMD (Data Managment Division) has just begun incorporating target photography from prior missions in target packets. This permits the phot-interpreter to identify significant change on a very rapid and more accurate basis. This service is expensive and application across the board is well beyond present-day DMD resources. The capability of recalling prior photographic coverage efficiently is one of the unsolved, long-range objectives in photo-interpretation procedure throughout the USIB community.
